

AI-Querist

A WhatsApp AI chatbot that uses Retrieval-Augmented Generation (RAG) for intelligent responses to Texas A&M organization related user queries.

1. Background and Motivation

Currently social messaging applications like iMessage, FB Messenger, WhatsApp, Instagram, Telegram, etc. are widely used and provide users with quick connectivity. It has changed the way people socialize and communicate. Concurrently, last few years witnessed a major evolution in Natural Language Processing (NLP) field. There has been a steep increase in user reliance on large language models (LLMs) such as Chat-Gpt, for obtaining answers to queries. Although these models have become increasingly prevalent now but their integration with social messaging applications is still a relatively untapped territory. This project aims to resolve this by designing and integrating LLM based chatbots with famous social messaging application, WhatsApp. This will enhance the user experience and streamline information retrieval through AI powered conversations directly from messaging application.

2. Objectives

1. Develop and integrate a LLM based chatbot within a social messaging platform, such as WhatsApp, to facilitate users with real-time interactions within messaging app.
2. Enabling chatbot to respond more accurately based on external database using Retrieval augmented generation (RAG) approach.

3. System Architecture and Components

a) Overview of Components:

WhatsApp Messenger:

WhatsApp is a well-known social messaging application that allows users to share text messages, audio messages, pictures, videos, and documents to any other registered user. It also allows users to create or engage in groups and communities.

WhatsApp Meta Manager:

WhatsApp Meta Manager application is one of the many tools and resources that Meta provides to developers to utilize and explore complete functionalities of WhatsApp messenger. Developers can incorporate WhatsApp features into their own applications and services using it. It gives access to services like sending/receiving WhatsApp messages, contact management, customer services, etc.

Flask Application:

Flask is a lightweight Python web framework that provides libraries and tools for developing web applications. It's based on the Python language and contains scripts to define web routes, views, and templates. It is very flexible, although it provides few built-in libraries to complete general tasks, we can easily integrate external libraries with it.

Documentation: <https://flask.palletsprojects.com/en/3.0.x/>

Chroma Database:

Chroma is an open source database that is used to store vector embedding and meta data of documents and texts. It is also used in retrieving data based on vector similarity of query embeddings with available database.

Documentation: <https://docs.trychroma.com/>

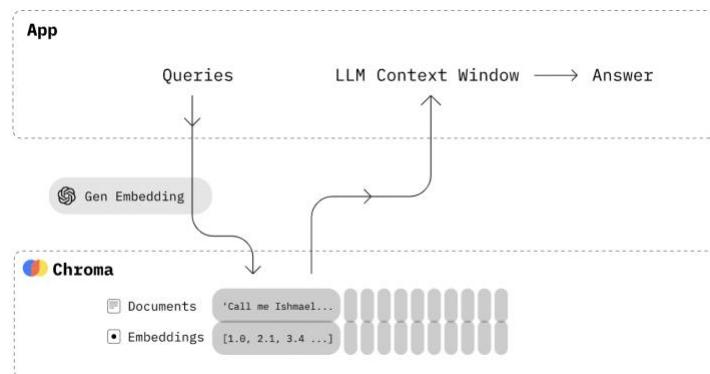

Figure 1: Text embedding illustration from Chroma (source: <https://docs.trychroma.com/>)

OpenAI API:

OpenAI API is the LLM model API provided by OpenAI that enables developer to access and utilize services of multiple OpenAI models. In this project it is being used for the purpose of text generation and embedding generation. I am using “gpt-3.5-turbo” model for generating responses to prompt queries.

Documentation: <https://platform.openai.com/docs/overview>

Dataset:

Texas A&M have around 1400 organization and societies. Although we have a well-organized website to search and find organization that suits our interests most, still website search just works on direct vector similarity to filter results and is therefore not natural language friendly. This reduces user experience and makes it difficult to explore and find societies of personal interest. I extracted all the organizations data from ‘stuactonline.tamu.edu’ through web-scraping and used it as external dataset to our RAG based chatbot.

Retrieval-Augmented Generation (RAG):

Retrieval Augmented Generation (RAG) approach helps users to get more accurate and personalized results to their queries using Large Language Models (LLMs). RAG make it possible for LLMs to refer external data outside of its training data sources before generating response. LLMs are trained using huge data sources and have billions of parameters which make them very powerful. RAG helps to utilize these powerful models in answering domain specific or private database related questions without the need to retrain complete LLMs.

For Instance, Chat-GPT is unable to answer a personalized contact related query. However, my RAG based Chat-GPT chatbot using Texas A&M organization's dataset answered it accurately as shown below.

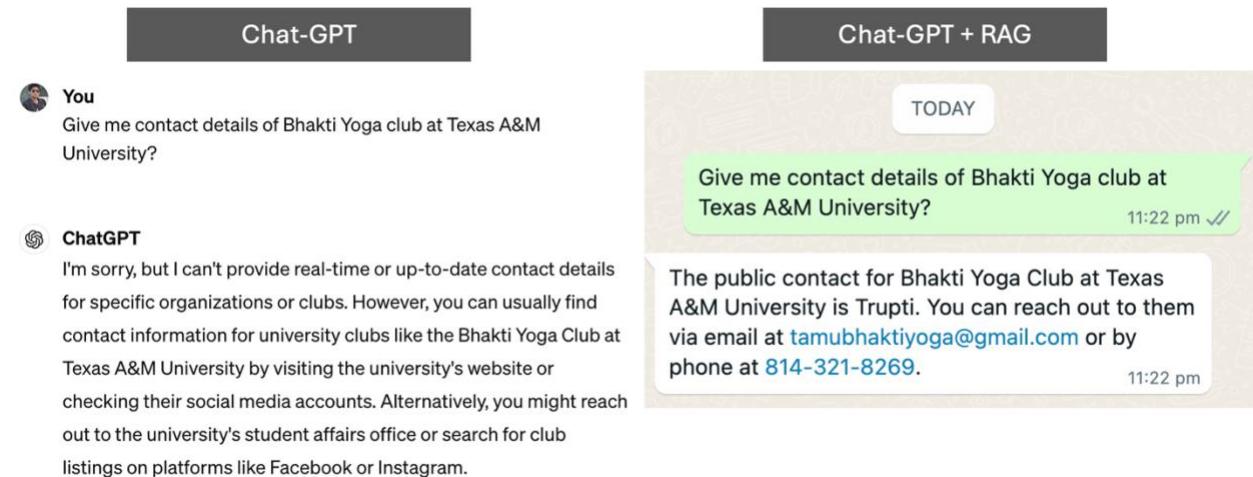

Figure 2: Query response with and without RAG

b) Workflow:

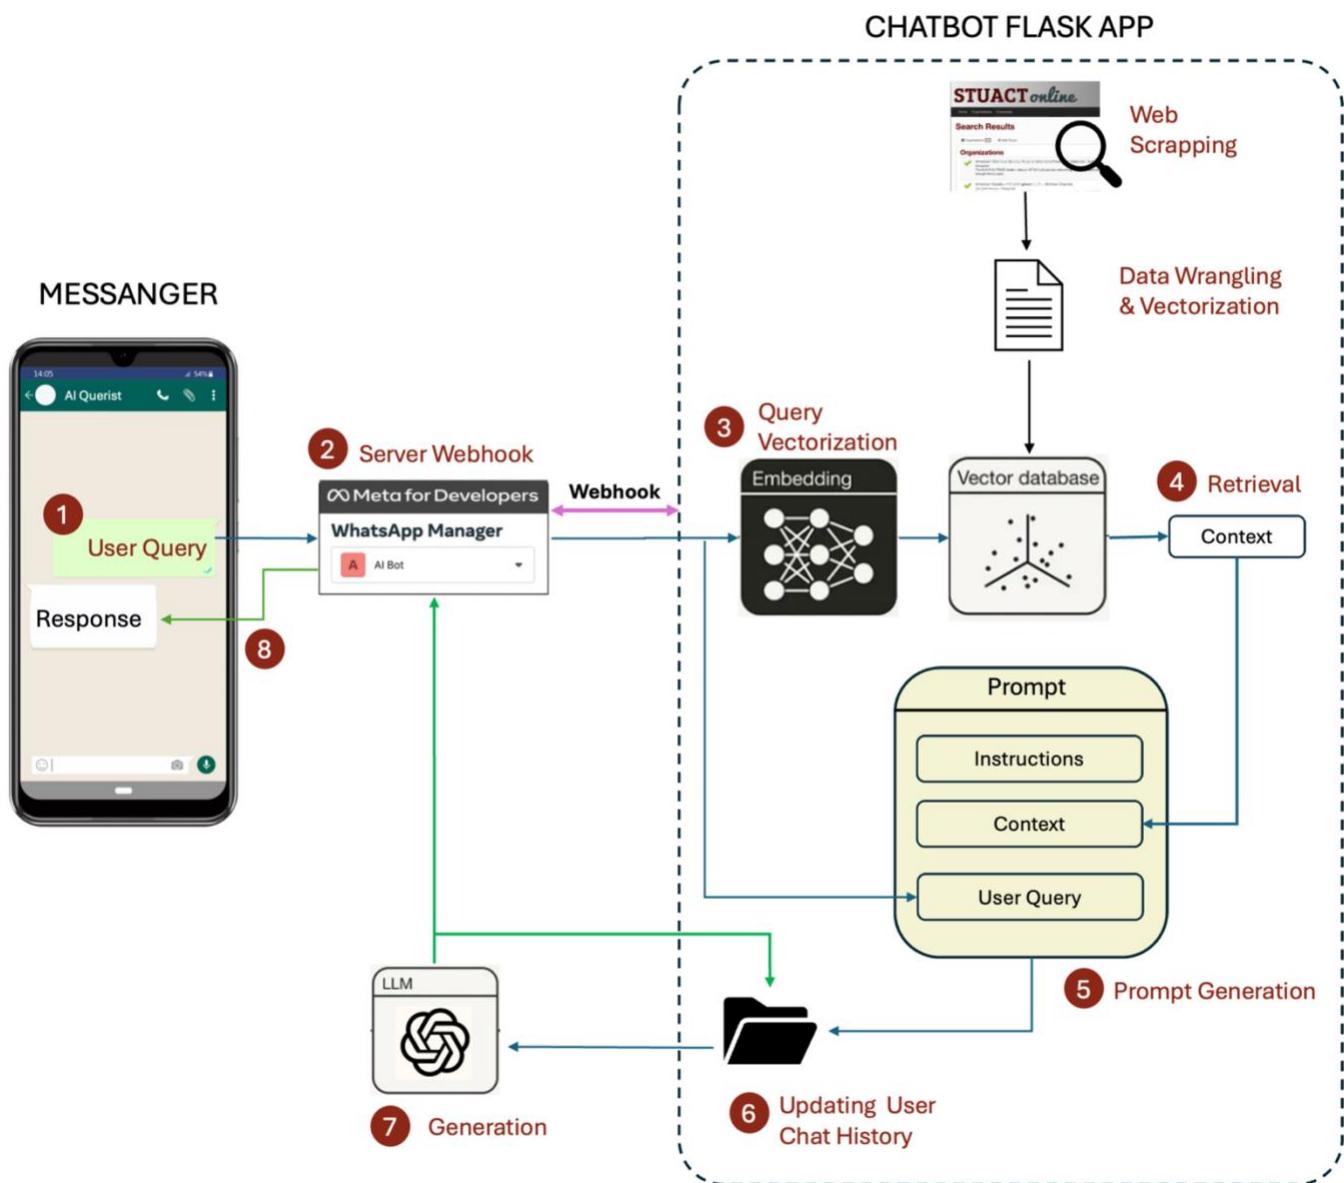

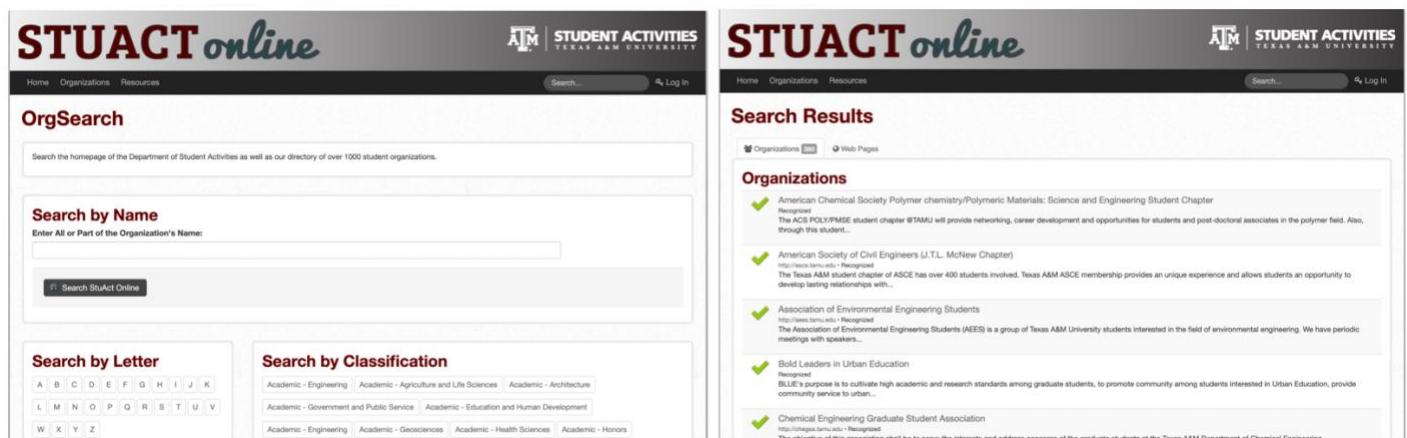

Figure 3: System Architecture and workflow

- 0) All Texas A&M organization related dataset is collected through web-scraping, cleaned, and converted to vector embedding using 'OpenAIEmbedding' model. These embeddings along with meta data are stored in Chroma Database.
- 1) **User Query** - User sends a Query related to Texas A&M organization on phone number of AI-Querist chatbot.
- 2) **Server Webhook** - The user query is received by WhatsApp Manager App on Meta server. This WhatsApp number is web-hooked with our Flask based chatbot server application. The user query is forwarded to chatbot application.
- 3) **Query Vectorization** - The user query is converted to embeddings using the same model by which dataset was vectorized.
- 4) **Retrieval** - The query embeddings are matched with stored dataset embeddings and top k results are retrieved as Context to the query.
- 5) **Prompt Generation** - The system instructions, context to query and user query are combined together along with role and a prompt is generated.
- 6) **Updating User Chat History** - The prompt is stored in user chat history and complete history is shared to model. This helps LLM to answer follow-up questions based on history.
- 7) **Generation** - The query prompt is shared to LLM API (OpenAI API) and response is received. This received response is added to User chat history and shared to WhatsApp Manager App.
- 8) The LLM response is directed to the user phone number on WhatsApp. The user can send a follow-up message to this conversation, which will directly get appended to the user chat history without context retrieval and will get response based on this. User can send 'reset' message on chatbot to clear previous history and start a fresh conversation.

4. Data Collection

a) Overview of data

I am using Texas A&M University organization dataset from STUACT online '<https://stuactonline.tamu.edu/app/search>' using web scraping. Texas A&M have around 1400 organizations and societies. All organization data is available on website but finding organization specific to interest areas is hard and is not natural language friendly.

The figure consists of two side-by-side screenshots of the STUACT online website. The left screenshot shows the search interface with sections for 'OrgSearch' and 'Search by Name'. The right screenshot shows the search results page with a list of organizations, each with a green checkmark and a brief description.

Left Screenshot (Search Interface):

- OrgSearch:** A search bar with placeholder text 'Search the homepage of the Department of Student Activities as well as our directory of over 1000 student organizations.'
- Search by Name:** A search bar with placeholder text 'Enter All or Part of the Organization's Name:' and a button labeled 'Search StuAct Online'.
- Search by Letter:** A grid of letters from A to Z.
- Search by Classification:** Categories: Academic - Engineering, Academic - Agriculture and Life Sciences, Academic - Architecture, Academic - Government and Public Service, Academic - Education and Human Development, Academic - Engineering, Academic - Geosciences, Academic - Health Sciences, Academic - Honors.

Right Screenshot (Search Results):

- Search Results:** A list of organizations with descriptions:
 - American Chemical Society Polymer chemistry/Polymeric Materials: Science and Engineering Student Chapter
 - American Society of Civil Engineers (J.T.L. McNew Chapter)
 - Association of Environmental Engineering Students (AEEES)
 - Bold Leaders in Urban Education
 - Chemical Engineering Graduate Student Association

Figure 4: Texas A&M University organization data on STUACT online

b) Web scraping:

I used a python script 'web_scraping.py' to extract organization data using web scraping. I used a HTML parser to extract all the data fields of every organization and stored it in a csv format. The csv 'organization_data.csv' contains 1435 rows each representing information for individual clubs.

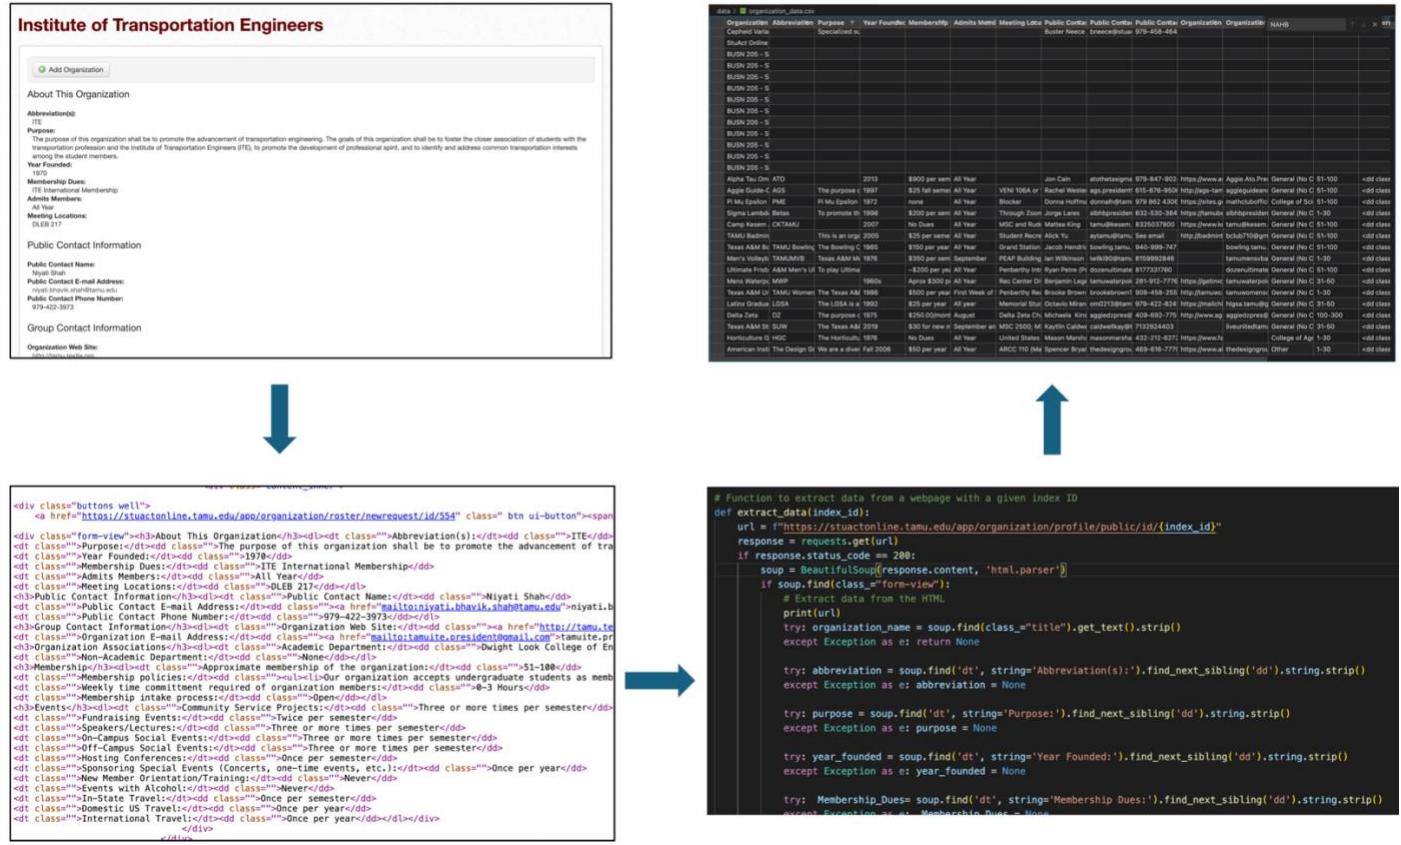

Figure 5: STUACT online data parsed using HTML parser and converted to CSV

c) Data Wrangling

The organization csv file generated using web scraping was even having data of organizations that no longer exist or for which incomplete data is available.

Thus, a need to clean data arise. I used a python script 'data_wrangler.py' to clean it. All the organizations that don't have enough data were removed and an updated 'organization_data_update.csv' was created with information of 1262 organizations.

```
data_wrangler.py <input>
app > ⌘ data_wrangler.py > ...
1 import csv
2 import pandas as pd
3
4 def merge_columns(row):
5     return '\n'.join(f'{column}: {value}' for column, value in row.items())
6
7 file = 'organization_data.csv'
8 df = pd.read_csv(file, header='infer')
9 df_filtered = df.dropna(thresh=len(df.columns) - 5 + 1)
10 df_filtered = df_filtered.fillna('NA')
11 # print(df_filtered.head())
12 # df_filtered['Organization Data'] = df_filtered.apply(merge_columns, axis=1)
13 # print(df_filtered['Organization Data'][6])
14 df_filtered.to_csv('organization_data_updated.csv')
15
16
```

Figure 6: Organization CSV dataset cleaned using data_wrangler.py script

5. Methodology and Implementation

a) WhatsApp Integration Setup

WhatsApp Manager application on Meta developer portal was created and a webhook was setup with our chatbot flask application. Following steps were followed:

- 1) Created Meta developer account.
- 2) Created WhatsApp Business account app inside Meta developer account.
- 3) Generate a free trial phone number - +1 (555)-133-0001.
- 4) Add recipient phone number in the verified recipient number list.
- 5) Go to WhatsApp configuration and add callback URL of chatbot flask application and verify the connection using secret 'Verify_token'.
- 6) Go to API setup menu and generate 'WhatsApp Token'. This token will be required to authenticate communication of WhatsApp manager with chatbot flask application.

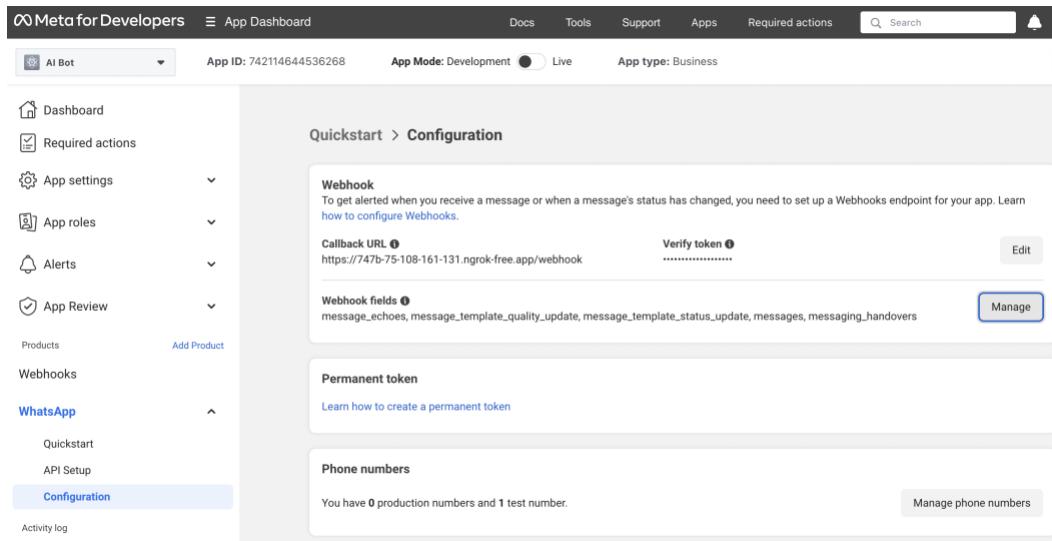

Figure 7: Configuring webhook on Meta WhatsApp Manager Application

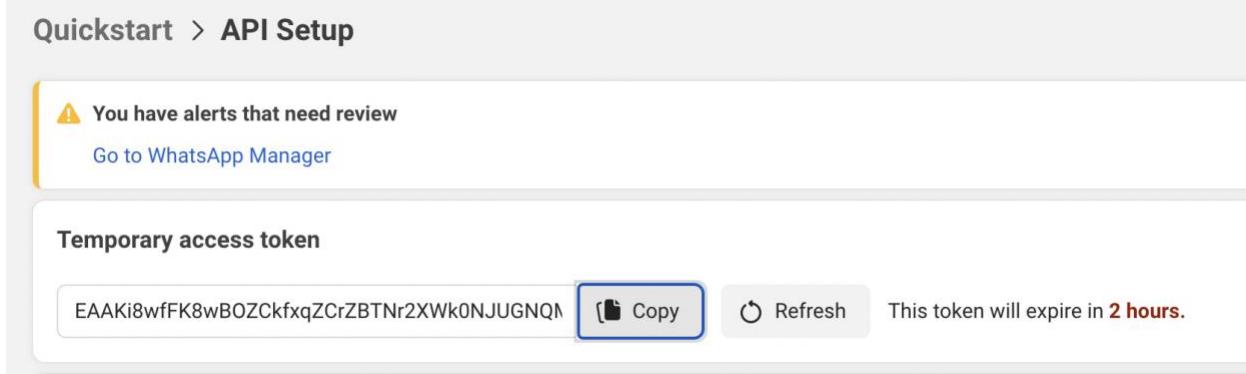

Figure 8: Generating WhatsApp token for authentication

b) Flask Framework Server Setup

Flask is a lightweight Python web framework that provides libraries and tools for developing web applications. It's easy to setup and can directly be used to create small applications. At first, install Flask library using pip, create an app instance and then the instance can be used directly to add any required routes to respond to REST API requests. I am running the flask app locally on my system for this project. I am using 'ngrok' to expose my local host port to internet.

```
from flask import Flask
app = Flask(__name__)

@app.route("/", methods=["GET"])
def home():
    return "WhatsApp OpenAI Webhook is listening!"

if __name__ == "__main__":
    app.run(host="0.0.0.0", port=8000, debug=True)
```

c) Creating Data Embeddings

I used Chroma Database to store data embedding and meta data of all the Texas A&M organizations. I used 'OpenAIEmbeddings' model to generate embedding of dataset and stored it in chroma database inside 'chroma_data' folder in base project directory. These embeddings will be used to do similarity search with query embeddings during context retrieval.

```
import dotenv
import os
from langchain.document_loaders.csv_loader import CSVLoader
from langchain_community.vectorstores import Chroma
from langchain_openai import OpenAIEMBEDDINGS
import pandas as pd

ORGs_CSV_PATH = ".../data/organization_data_updated.csv"
ORGs_CHROMA_PATH = "chroma_data"

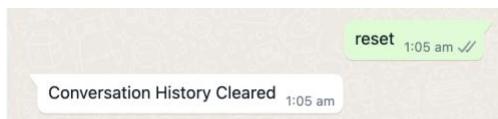

dotenv.load_dotenv()

loader = CSVLoader(file_path=ORGs_CSV_PATH)
# loader = CSVLoader(file_path=ORGs_CSV_PATH, source_column="Purpose")
orgs = loader.load()

reviews_vector_db = Chroma.from_documents([
    orgs, OpenAIEMBEDDINGS(), persist_directory=ORGs_CHROMA_PATH
])
```

d) WhatsApp Message Retrieval

After successfully authenticating and validating webhook communication between WhatsApp manager and chatbot flask app, any message that user is sending can be directly received using below code. Various required parameters like message body, to phone number, from phone number, etc. are extracted from received message. The message body i.e user query is retrieved and used for context retrieval, post which it is appended to prompt and shared to LLM model for getting response. User can send 'reset' message as query to delete complete conversation history and start afresh.

```

47     # handling messages received from whatsapp
48     def process_message(request):
49         body = request.get_json()
50         # print(f"request body: {body}")
51         try:
52             if body.get("object"):
53                 if (
54                     body.get("entry")
55                     and body["entry"][0].get("changes")
56                     and body["entry"][0]["changes"][0].get("value")
57                     and body["entry"][0]["changes"][0]["value"].get("messages")
58                     and body["entry"][0]["changes"][0]["value"]["messages"][0]
59                 ):
60                     message = body["entry"][0]["changes"][0]["value"]["messages"][0]
61                     if message["type"] == "text":
62                         print("message is:", message["text"]["body"])
63                         if message["text"]["body"] == 'reset':
64                             message_history_dic.pop(message["from"])
65                             reply_to_whatsapp(body, 'Conversation History Cleared')
66                         else:
67                             response = request_llm_model(message["text"]["body"], message["from"])
68                             reply_to_whatsapp(body, response)
69                         else:
70                             print("message is not text")
71                             reply_to_whatsapp(body, 'send message in text form')
72
73                     return jsonify({"status": "ok"}), 200
74                 else:
75                     # if the request is not a WhatsApp API event, return an error
76                     return (jsonify({"status": "error", "message": "Not a WhatsApp API event"}), 404,)
77
78             except Exception as e:
79                 print('error:', e)
80                 return jsonify({"status": "error", "message": str(e)}), 500

```

e) Contextual Data Retrieval

The received user query is converted to embedding using same model that was used for dataset vectorization. These embeddings are then used to do similarity search on stored dataset and top k (4 in this project) results are retrieved. These retrieved docs along with instruction and user query are appended to user chat history.

```

import dotenv
from langchain_community.vectorstores import Chroma
from langchain_openai import OpenAIEMBEDDINGS

ORGs_CHROMA_PATH = "chroma_data/"

dotenv.load_dotenv()

orgs_vector_db = Chroma(
    persist_directory=ORGs_CHROMA_PATH,
    embedding_function=OpenAIEMBEDDINGS(),
)

question = """I am interested in organization that would expose me to indian culture."""
relevant_docs = orgs_vector_db.similarity_search(question, k=3)

```

f) Generation Component Implementation

After query retrieval and context retrieval, the complete message log in user chat history is shared with LLM Model API (gpt-3.5-turbo). The model uses its AI capabilities and shared external context data to generate a response to user query. The response is again added to user chat history and shared back to message processing function.

```
#requesting llm model and receiving the response
def request_llm_model(message, from_number):
    try:
        message_log = add_message_in_log(message, from_number, "user")
        print('sending following message to model: ', message_log)
        response = client.chat.completions.create(
            model="gpt-3.5-turbo",
            messages=message_log,
            temperature=0.0,
            max_tokens=100,
            top_p=1,
            frequency_penalty=0,
            presence_penalty=0
        )
        response_message = response.choices[0].message.content
        print(f"openai response: {response_message}")

        message_log = {"role": "assistant", "content": response_message}
        message_history_dict[from_number].append(message_log)

    except Exception as e:
        print(f"openai error: {e}")
        response_message = "Sorry, the OpenAI API is currently overloaded or offline. Please try again later."
        message_history_dict[from_number].pop()
    return response_message
```

g) Sending Response

The received response from LLM model is shared to WhatsApp Manager app along with recipient phone number. It is then forwarded to the user from there.

```
# send LLM response to the user through whatsapp
def reply_to_whatsapp(body, message):
    value = body["entry"][0]["changes"][0]["value"]
    phone_number_id = value["metadata"]["phone_number_id"]
    from_number = value["messages"][0]["from"]
    headers = {
        "Authorization": f"Bearer {whatsapp_token}",
        "Content-Type": "application/json",
    }
    url = "https://graph.facebook.com/v18.0/" + phone_number_id + "/messages"
    data = {
        "messaging_product": "whatsapp",
        "to": from_number,
        "type": "text",
        "text": {"body": message},
    }
    response = requests.post(url, json=data, headers=headers)
    print(f"whatsapp message response: {response.json()}")
    response.raise_for_status()
```

6. Application Setup

a) Installation and Configuration

Follow given steps to setup the chatbot flask application:

- 1) Clone the project from GitHub using below command.

```
git clone https://github.com/ashuchauhan171996/AI-Querist.git
```

- 2) Create virtual environment and install all the required dependencies using 'requirements.txt'
- 3) Go inside app folder and run flask application from there using following command. This will start the chatbot flask application on localhost at port 8000.

```
python app_flask.py
```

- 4) Install 'ngrok' and create account. Setup 'ngrok' on your laptop and use following command to expose localhost server to internet. Now your chatbot server is running locally and can be accessed from anywhere.

```
ngrok http http://localhost:8000
```

- 5) Login to meta developer account. Add ngrok webhook URL in configuration section and validate webhook as discussed above.
- 6) We are all set! Send any Texas A&M organization related query from registered WhatsApp number to the test phone number (+1 (555)-133-0001) and you will get response instantly. Few conversation examples can be found in Annexure 1.

b) Setting Environment Variables

For app to work successfully ensure that all the environment tokens and keys are added to the .env file. This project requires these three tokens:

```
⚙ .env
OPENAI_API_KEY = "REDACTED"
WHATSAPP_TOKEN= 'REDACTED'
VERIFY_TOKEN= 'REDACTED'
```

7. Results

a) Example Snippets:

Examples can be found in Annexure 1

8. Discussion

a) Challenges Faced:

Building a 4-party infrastructure in this project was very challenging. Complex intercommunication configurations, authentications and validations were needed to integrate WhatsApp, Meta developer tool, OpenAI and Chatbot Flask application altogether.

b) Major Learnings:

1. Concept and implementation of Retrieval-Augmented Generation (RAG) approach to get more accurate and personalized results to queries using Large Language Models (LLMs).
2. Understood how to create or use existing applications in Meta developer platform.
3. Implemented an active webhook between two applications.
4. Learnt accessing existing state of art LLM models APIs (gpt-3.5-turbo).

9. Conclusion:

This project showed us how we can use existing powerful LLM models to answer queries on external dataset using RAG approach. In this project we solved the problem to retrieve information on various Texas A&M organizations and it performed well. We integrated it with social platform to enhance the user experience and streamline information retrieval through AI powered conversations directly from messaging application.

This project was a great example of how we can use existing complex models to solve daily issues. The AI enabled chatbots open doors to lot of applications across diverse fields. Moving forward, this would have enormous potential to revolutionize workflows and improve user experiences in every domain.

I am very interested in hiking. Suggest me few organizations that I can join? 1:48 am ✓

You may be interested in joining Aggie Outdoors (AO) at Texas A&M University. They focus on outdoor activities and provide opportunities to increase knowledge and experience in the outdoors. You can also consider checking out their website for more information: <https://aggieoutdoors.wixsite.com/ao-1> 1:49 am

Could you suggest few more? 1:49 am ✓

Another organization you may be interested in is the Bhakti Yoga Club (BYC-TAMU) at Texas A&M University. While their focus is on yoga, they may also offer outdoor activities or events that align with your interest in hiking. Feel free to visit their website for more details: <http://www.tamubhaktiyoga.org> 1:49 am

Can you give me email id of BYC club coordinator ? 1:52 am ✓

The email address for the Bhakti Yoga Club (BYC-TAMU) coordinator is tamubhaktiyoga@gmail.com. Feel free to reach out to them for more information or any inquiries you may have. 1:52 am

meets at MSC 2406A. 12:49 am

Recently I have started gaining weight and looking to join some Yoga or physical activities club. Could you suggest me few? 12:59 am

You can consider joining the Bhakti Yoga Club (BYC-TAMU) or the TAMU Gymnastics Club (Gym Club) for yoga and physical activities respectively. Both clubs offer opportunities for physical fitness and well-being. 12:59 am

Are these free of cost or have a membership fee? 1:00 am

The Bhakti Yoga Club (BYC-TAMU) does not have membership dues, while the TAMU Gymnastics Club (Gym Club) has membership dues of \$150 per year or \$85 per semester. 1:00 am

Whats the approx no. of members in these? 1:01 am

The Bhakti Yoga Club (BYC-TAMU) has approximately 31-50 members, and the TAMU Gymnastics Club (Gym Club) has approximately 51-100 members. 1:01 am

impact on campus. You can visit their website or contact their public office for more information.

12:02 am

I came to US last year and want to know more about the christian culture. Suggest me some organization that would help me to know more about christian religion and Jesus Christ?

12:46 am ✓

I recommend you check out "Christians at Texas A&M" (Christians at TAMU) and "TAMU Campus Crusade for Christ" (Cru). Both organizations focus on spreading the gospel of Jesus Christ and fostering Christian fellowship among students. You can contact them for more information and get involved in their activities to learn more about Christian culture and beliefs.

12:46 am

Can you tell me weekly time commitment required in both of these orgs?

12:47 am ✓

Both "Christians at Texas A&M" and "TAMU Campus Crusade for Christ" require a weekly time commitment of 0-3 hours from their members.

12:47 am

Nice!! Give me website link and contact details for both. Also tell me where do they usually meet?

10

For "Christians at Texas A&M," you can visit their website at <http://www.christiansattamu.com>. The public contact details are Sofiya Bettencourt at christiansattamu@gmail.com or +15094962899. They primarily meet on campus, with locations including the MSC and Psyc.

For "TAMU Campus Crusade for Christ," you can visit their website at <https://www.aggiecru.com>. The public contact is Dan Dillard at daniel

12:49 am

Where cru's meet? 12:49 am //

TAMU Campus Crusade for Christ (Cru) usually meets at MSC 2406A.

12:49 am

may have.

TODAY

I am looking to join some organization that will help me to improve my communication and social skills. Can you suggest me few? 9:27 pm ✓

You may consider joining the Texas A&M Pre-Speech and Language Pathology Society (PSLP) or the Public Relations, Influencing, and Social Media organization (PRISM). Both organizations provide opportunities to enhance communication and social skills through networking, workshops, and events. 9:27 pm

Interesting! Give me contact details and website for both. 9:28 pm ✓

For the Texas A&M Pre-Speech and Language Pathology Society (PSLP):

- Public Contact Name: Riley Hull
- Public Contact E-mail Address: rah8626@tamu.edu
- Public Contact Phone Number: 832-470-4786
- Organization Website: <http://tamupsdp.weebly.com>

For the Public Relations, Influencing, and Social Media organization (PRISM):

- Public Contact Name: Lexi Vallandingham
- Public Contact

9:28 pm
